

# Command line usage and plotting with Madagascar

Ben Witten

# Outline

- RSF data format
- Command line usage
- Plotting

# RSF data format

- RSF := regularly sampled format
  - Data exists on a N-dimensional grid

# RSF data format

- RSF := regularly sampled format
  - Data exists on a N-dimensional grid
    - *Storing large-scale datasets in a text format may not be economical. RSF chooses the next best thing: it allows data values to be stored in a binary format but puts all data attributes in text files that can be read by humans and processed with universal text-processing utilities.*

# RSF data format

*.rsf		*.rsf@
Header file		Binary file in column major order
Information about the origin, sampling, data type, data format, labels, where the binary lives, size of binary		The actual data
Human readable, contains history of what has been done		Not human readable

# Madagascar programs

- Most programs begin with the prefix “sf”
- Can “pipe” from one program to another to avoid intermediate files
- Examples: sftransp, sffft, sfbandpass, sfseggyread

<http://www.reproducibility.org/RSF/>

The image shows a screenshot of a software dependency graph, likely generated by a tool like Reproducible Software Framework (RSF). The graph is organized into a grid-like structure with multiple rows and columns. Each row represents a different component or module, and the columns show the dependencies of that component. The components are listed in a hierarchical manner, with some components having multiple sub-dependencies. The graph is color-coded, with pink and light blue highlighting different sections or types of dependencies. The overall structure is complex, illustrating the interconnected nature of the software ecosystem.

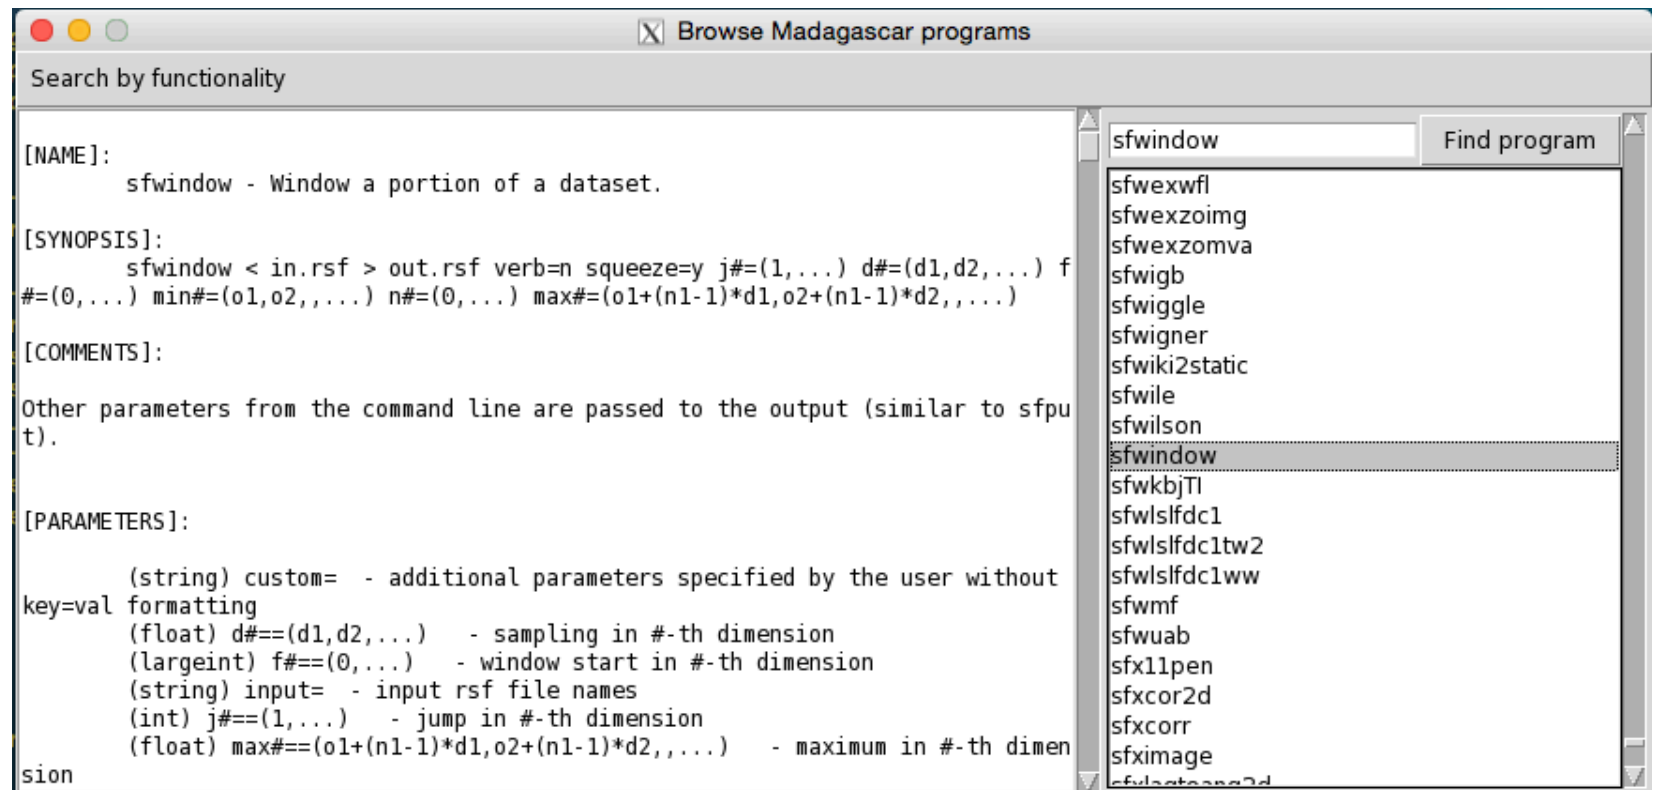

# Program documentation

- Each program has self-documentation
- Type the program name without parameters to bring it up

```

[wituwa:~] bwitter% sfbandpass
NAME
    sfbandpass
DESCRIPTION
    Bandpass filtering.
SYNOPSIS
    sfbandpass < in.rsf > out.rsf flo= fhi= phase=n verb=n nplo=6 nphi=6
COMMENTS
    November 2012 program of the month:
    http://ahay.org/rsflog/index.php?archives/313-Program-of-the-month-sfbandpass.html
PARAMETERS
    float fhi=    High frequency in band, default is Nyquist
    float flo=    Low frequency in band, default is 0
    int   nphi=6  number of poles for high cutoff
    int   nplo=6  number of poles for low cutoff
    bool  phase=n [y/n]  y: minimum phase, n: zero phase
    bool  verb=n [y/n]   verbosity flag
```

# Program documentation

- sfbrowser

# Basic Madagascar usage

< input.rsf sfprogram par1= par2= > output.rsf

“<” = input sign: next string is taken as input

“>” = output sign : next string is taken as output

Note: does not have to be written in this order

# Basic Madagascar usage

< input.rsf sfprogram par1= par2= > output.rsf

# Basic Madagascar usage

< input.rsf sfprogram par1= par2= > output.rsf

sfprogram < input.rsf par1= par2= > output.rsf

# Basic Madagascar usage

< input.rsfc sfprogram par1= par2= > output.rsfc

sfprogram < input.rsfc par1= par2= > output.rsfc

sfprogram par1= par2= < input.rsfc > output.rsfc

# Basic Madagascar usage

< input.rsf sfprogram par1= par2= > output.rsf

sfprogram < input.rsf par1= par2= > output.rsf

sfprogram par1= par2= < input.rsf > output.rsf

> output.rsf sfprogram par1= par2= < input.rsf

# Let's do some

```
sfspike n1=100 k1=20 > file.rs
```

# Let's do some

```
sfspike n1=100 k1=20 > file.rsf
```

```
sfin < file.rsf (or sfin file.rsf )
```

sfin is probably the most commonly used program. It shows information about the file

```
[wituwa:~] bwitten% sfin < file.rsf
in:
  in="/var/tmp/file.rsf@"
  esize=4 type=float form=native
  n1=100          d1=0.004          o1=0          label1="Time" unit1="s"
    100 elements 400 bytes
```

# Let's do some

```
sfspike n1=100 k1=20 > file.rsf
```

```
sfin < file.rsf (or sfin file.rsf )
```

sfin is probably the most commonly used program. It shows information about the file

```
[wituwa:~] bwitten% sfin < file.rsf

```

# Let's do some

`sfspike n1=100 k1=20 > file.rsfsf`

`sfin < file.rsfsf` (or `sfin file.rsfsf` )

`sfsfattr < file.rsfsf`

`sfsfattr` may be the 2<sup>nd</sup> most common program

```
[wituwa:~] bwitten% sfsfattr < file.rsfsf
*****
rms = 0.1
mean = 0.01
2-norm = 1
variance = 0.01
std dev = 0.1
max = 1 at 20
min = 0 at 1
nonzero samples = 1
total samples = 100
*****
```

`sfsfattr` provides  
statistics about the  
data set

# Why is sfin important?

- Quickly provide information about your data
  - Size
  - Dimensionality
  - Sampling
  - If its all there

# Why is sfin important?

- Quickly provide information about your data
  - Size
  - Dimensionality
  - Sampling
  - If its all there --- Come back to this

# Piping programs

Method 1:

```
sfspike n1=100 k1=20 > file.rsf
```

```
sfbandpass < file.rsf flo=1 fhi=40 > file2.rsf
```

# Piping programs

Method 1:

```
sfspike n1=100 k1=20 > file.rsf
```

```
sfbandpass < file.rsf flo=1 fhi=40 > file2.rsf
```

Let's say we don't care about file.rsf, just file2.rsf

No need to create file.rsf

# Piping programs

Method 2:

```
sfspike n1=100 k1=20 |sfbandpass flo=1 fhi=40 > file3.rs
```

No intermediate files now.

# Header file

- Earlier I mentioned that the \*.rsf stores the history of what has been done to the data
- Use your favorite text editor to open file2.rsf or file3.rsf

# Header/History file

- File2.rsfc

```
[wituwa:~] bwitten% cat file2.rsfc
1.6      sfspike Users/bwitten:  bwitten@wituwa.local    Thu Jun 18 14:21:13 2015

        o1=0
        label1="Time"
        data_format="native_float"
        esize=4
        in="/var/tmp/file.rsfc@"
        unit1="s"
        d1=0.004
        n1=100
1.6      sfbandpass      Users/bwitten:  bwitten@wituwa.local    Thu Jun 18 14:27:27 2015

        data_format="native_float"
        esize=4
        in="/var/tmp/file2.rsfc@"
```

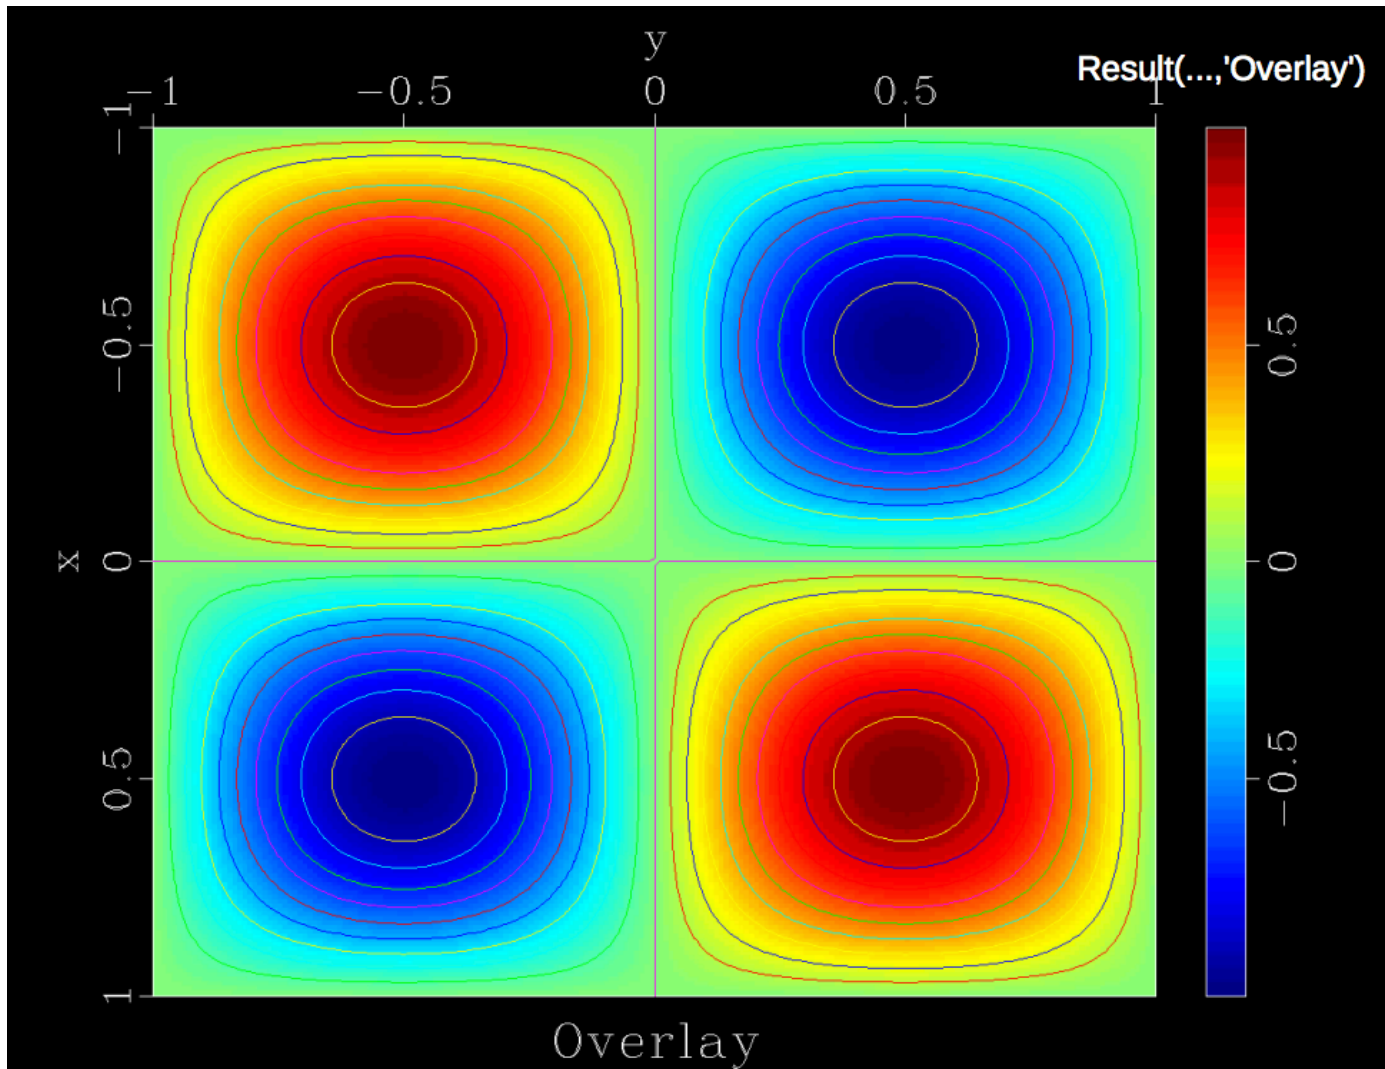

# Back to sfin

- What sfin actually does is read the \*.rsf file from bottom to top looking for n[1,2,3..], d[1,2,3...], o[1,2,3...], esize, etc
- Calculate size and print to screen
- Great feature is that it can tell you if you don't have the "correct" data size

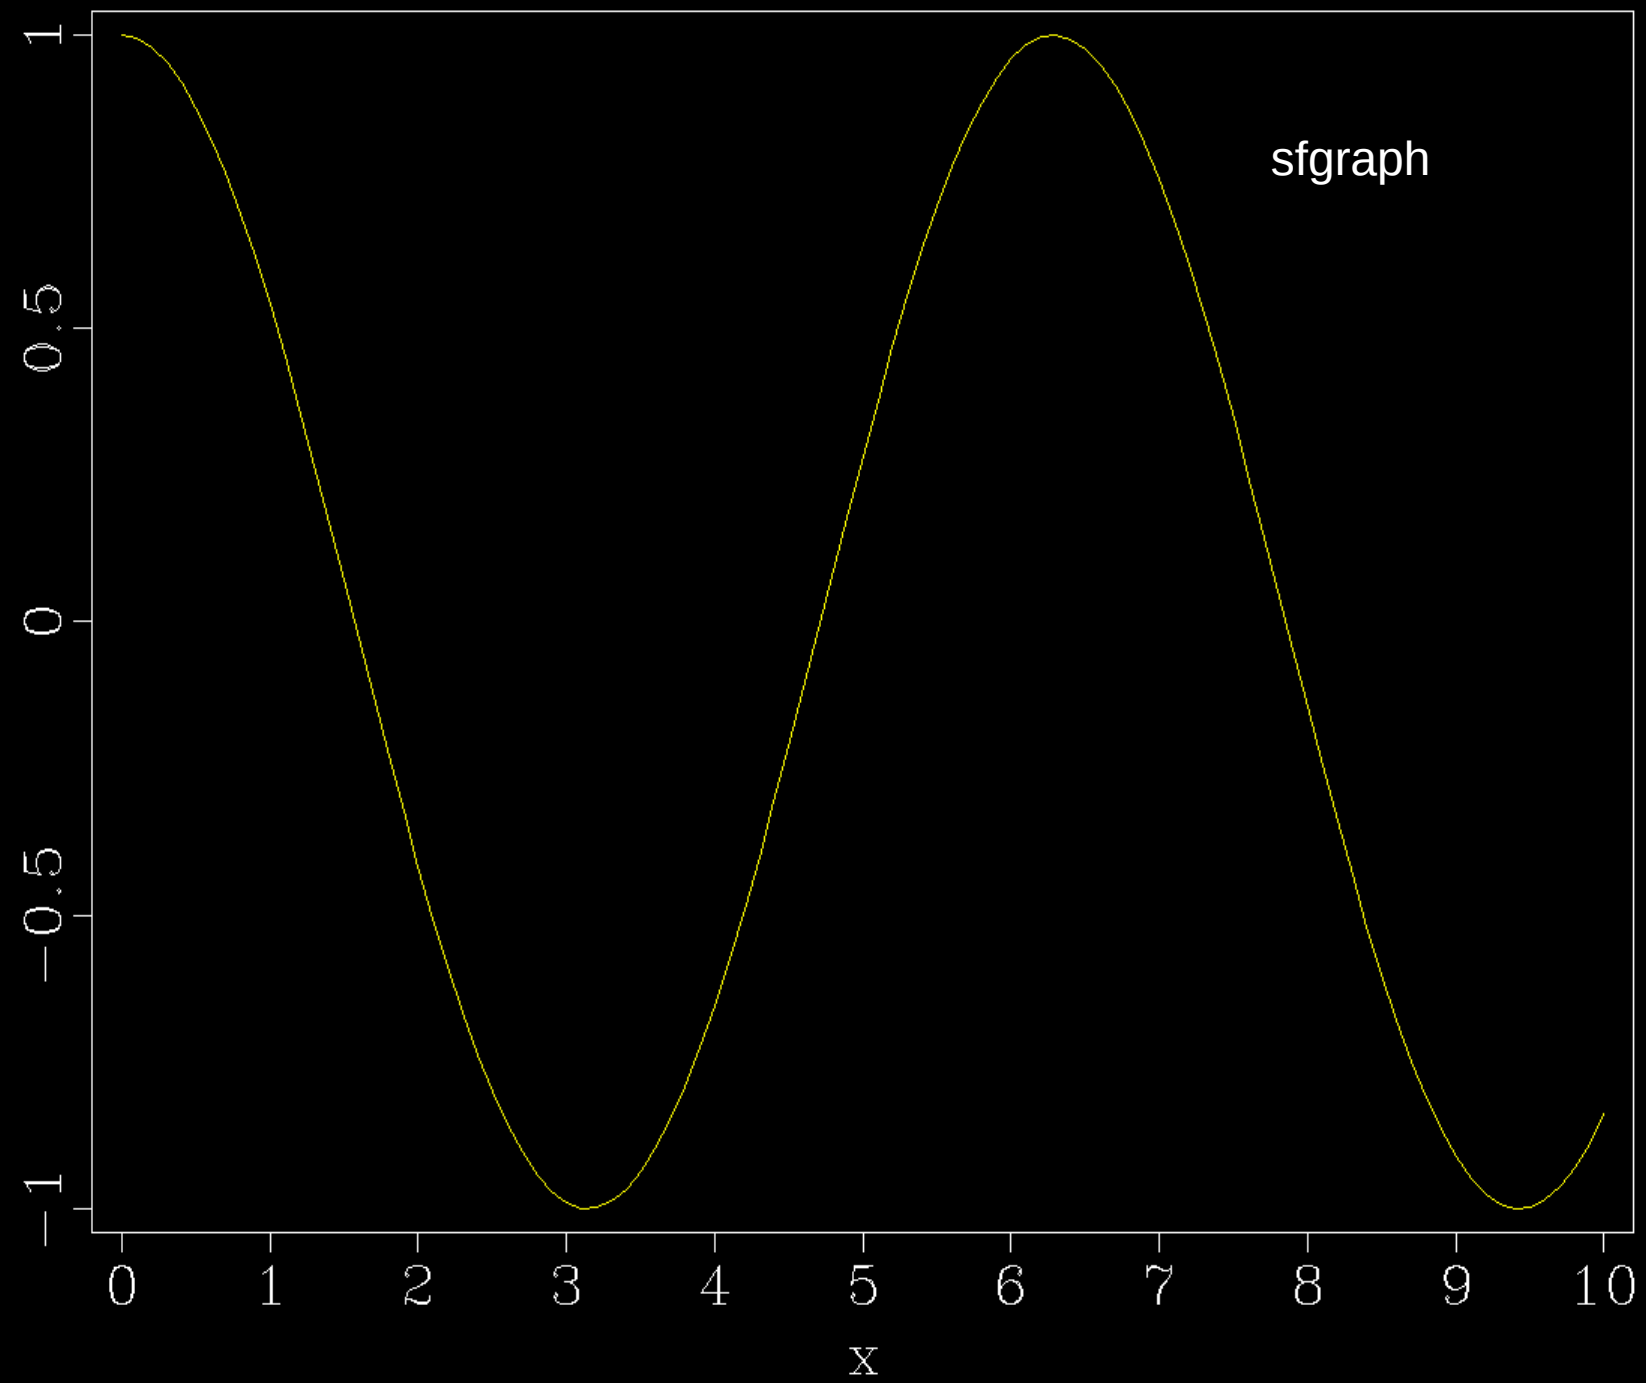

# Back to sfin

- What sfin actually does is read the \*.rsf file from bottom to top looking for n[1,2,3..], d[1,2,3...], o[1,2,3...], esize, etc
- Calculate size and print to screen
- Great feature is that it can tell you if you don't have the "correct" data size
- TEST: change n1=100 to n1=90 in file2.rs
- Run sfin file2.rs
- Go change it back

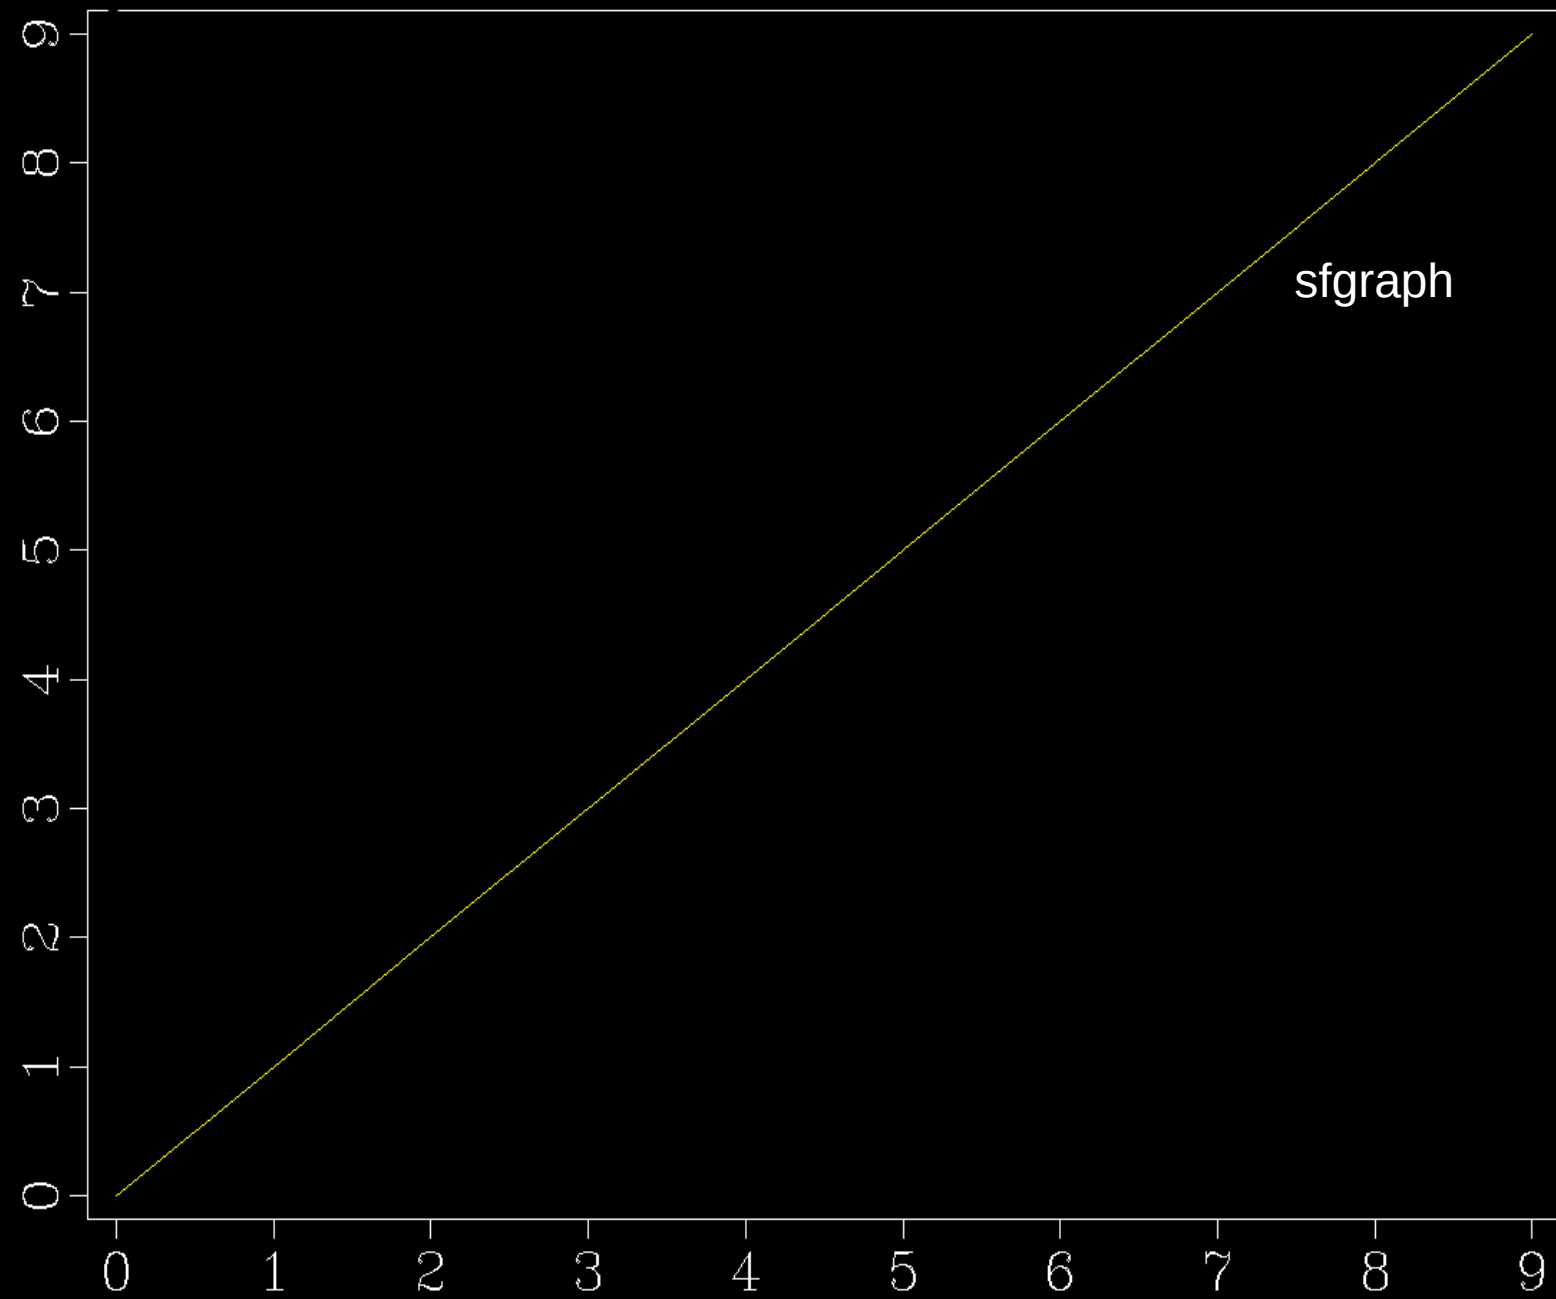

# Plotting

$\cos(x)$

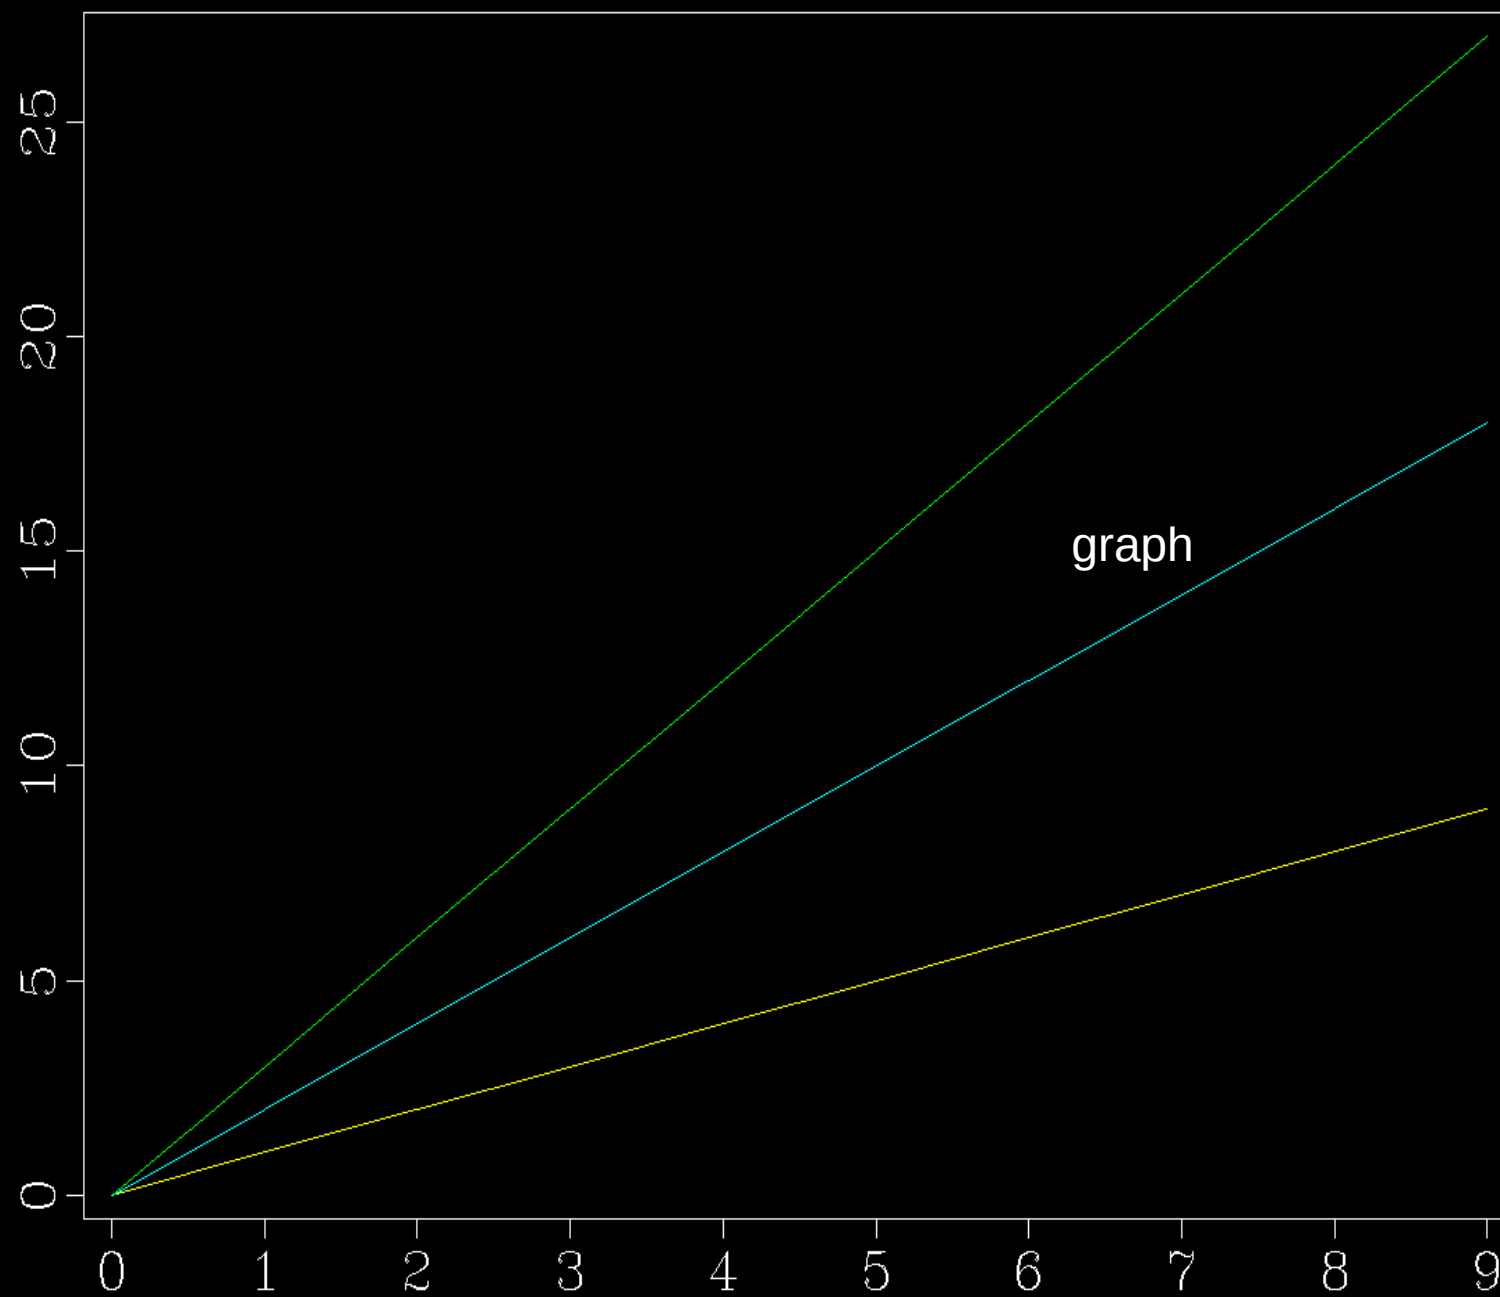

# Line

Line,  $x^2$

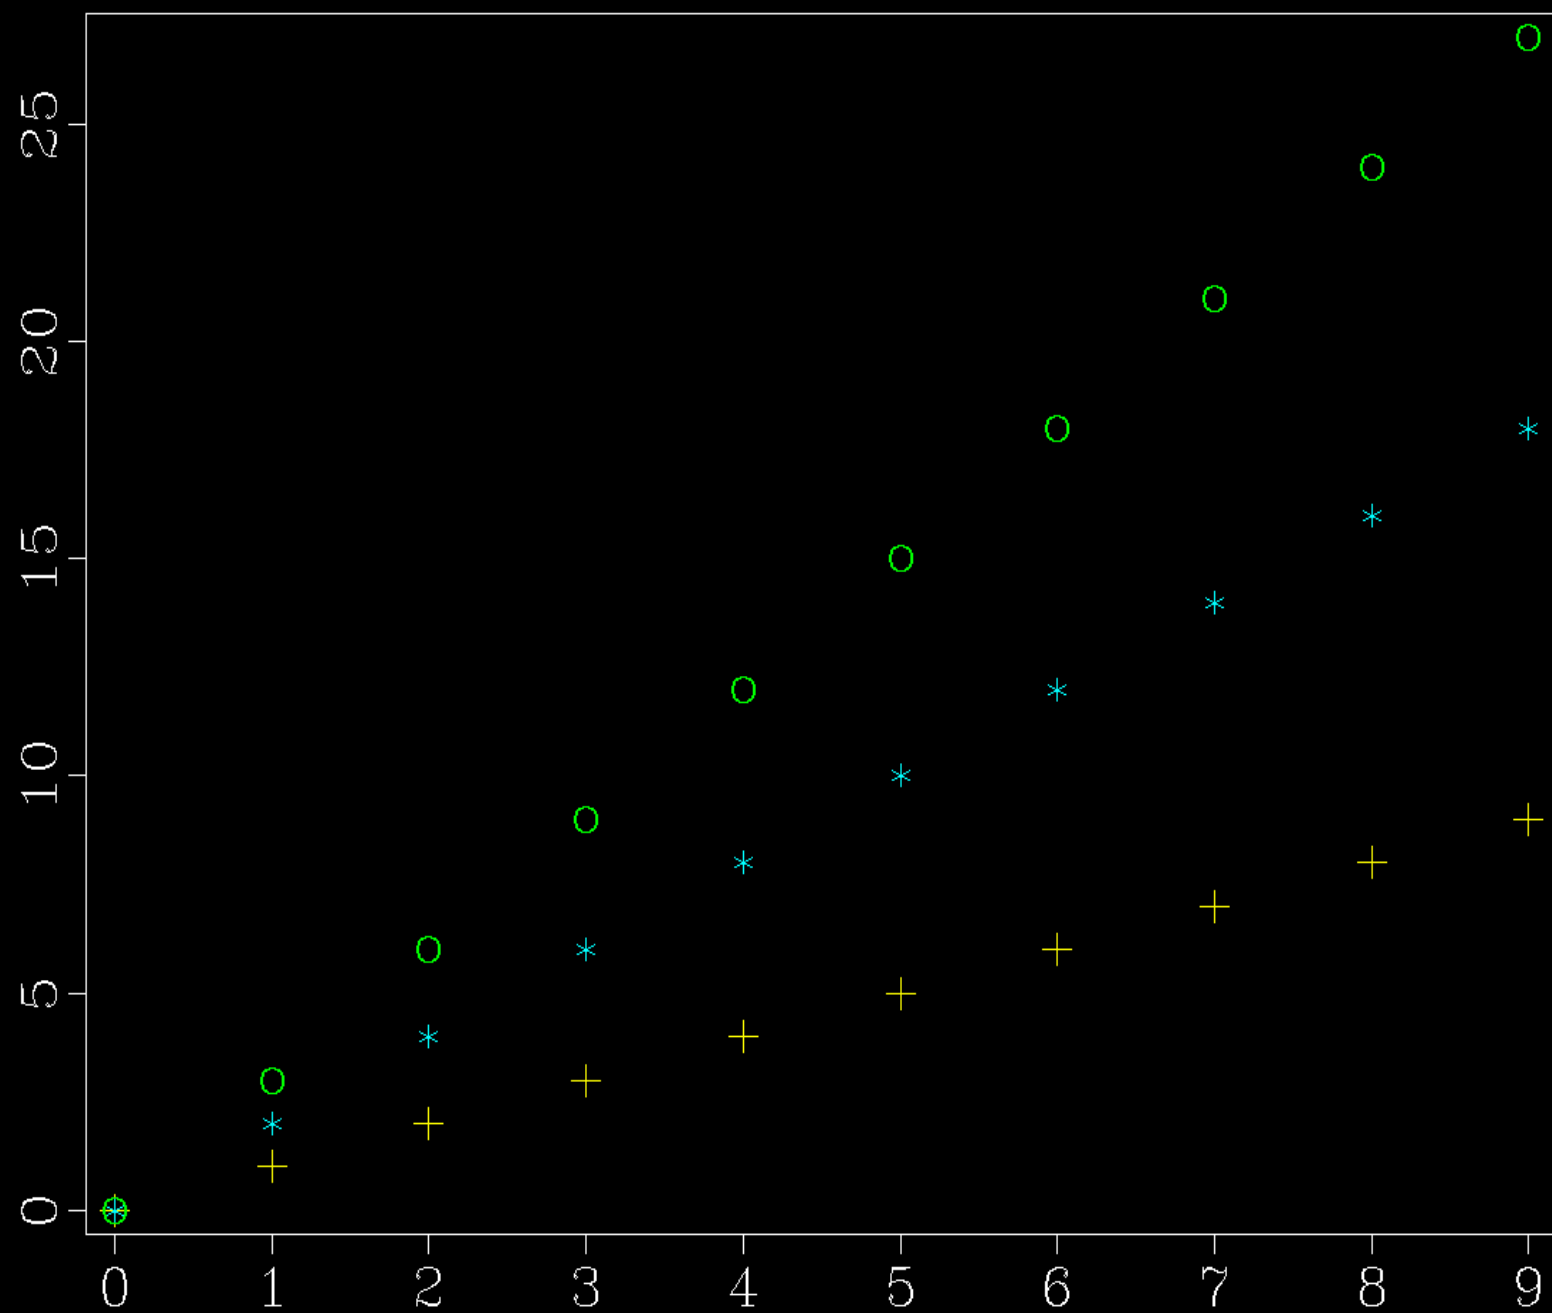

Multiple lines,  $n3 > 1$

With symbol=

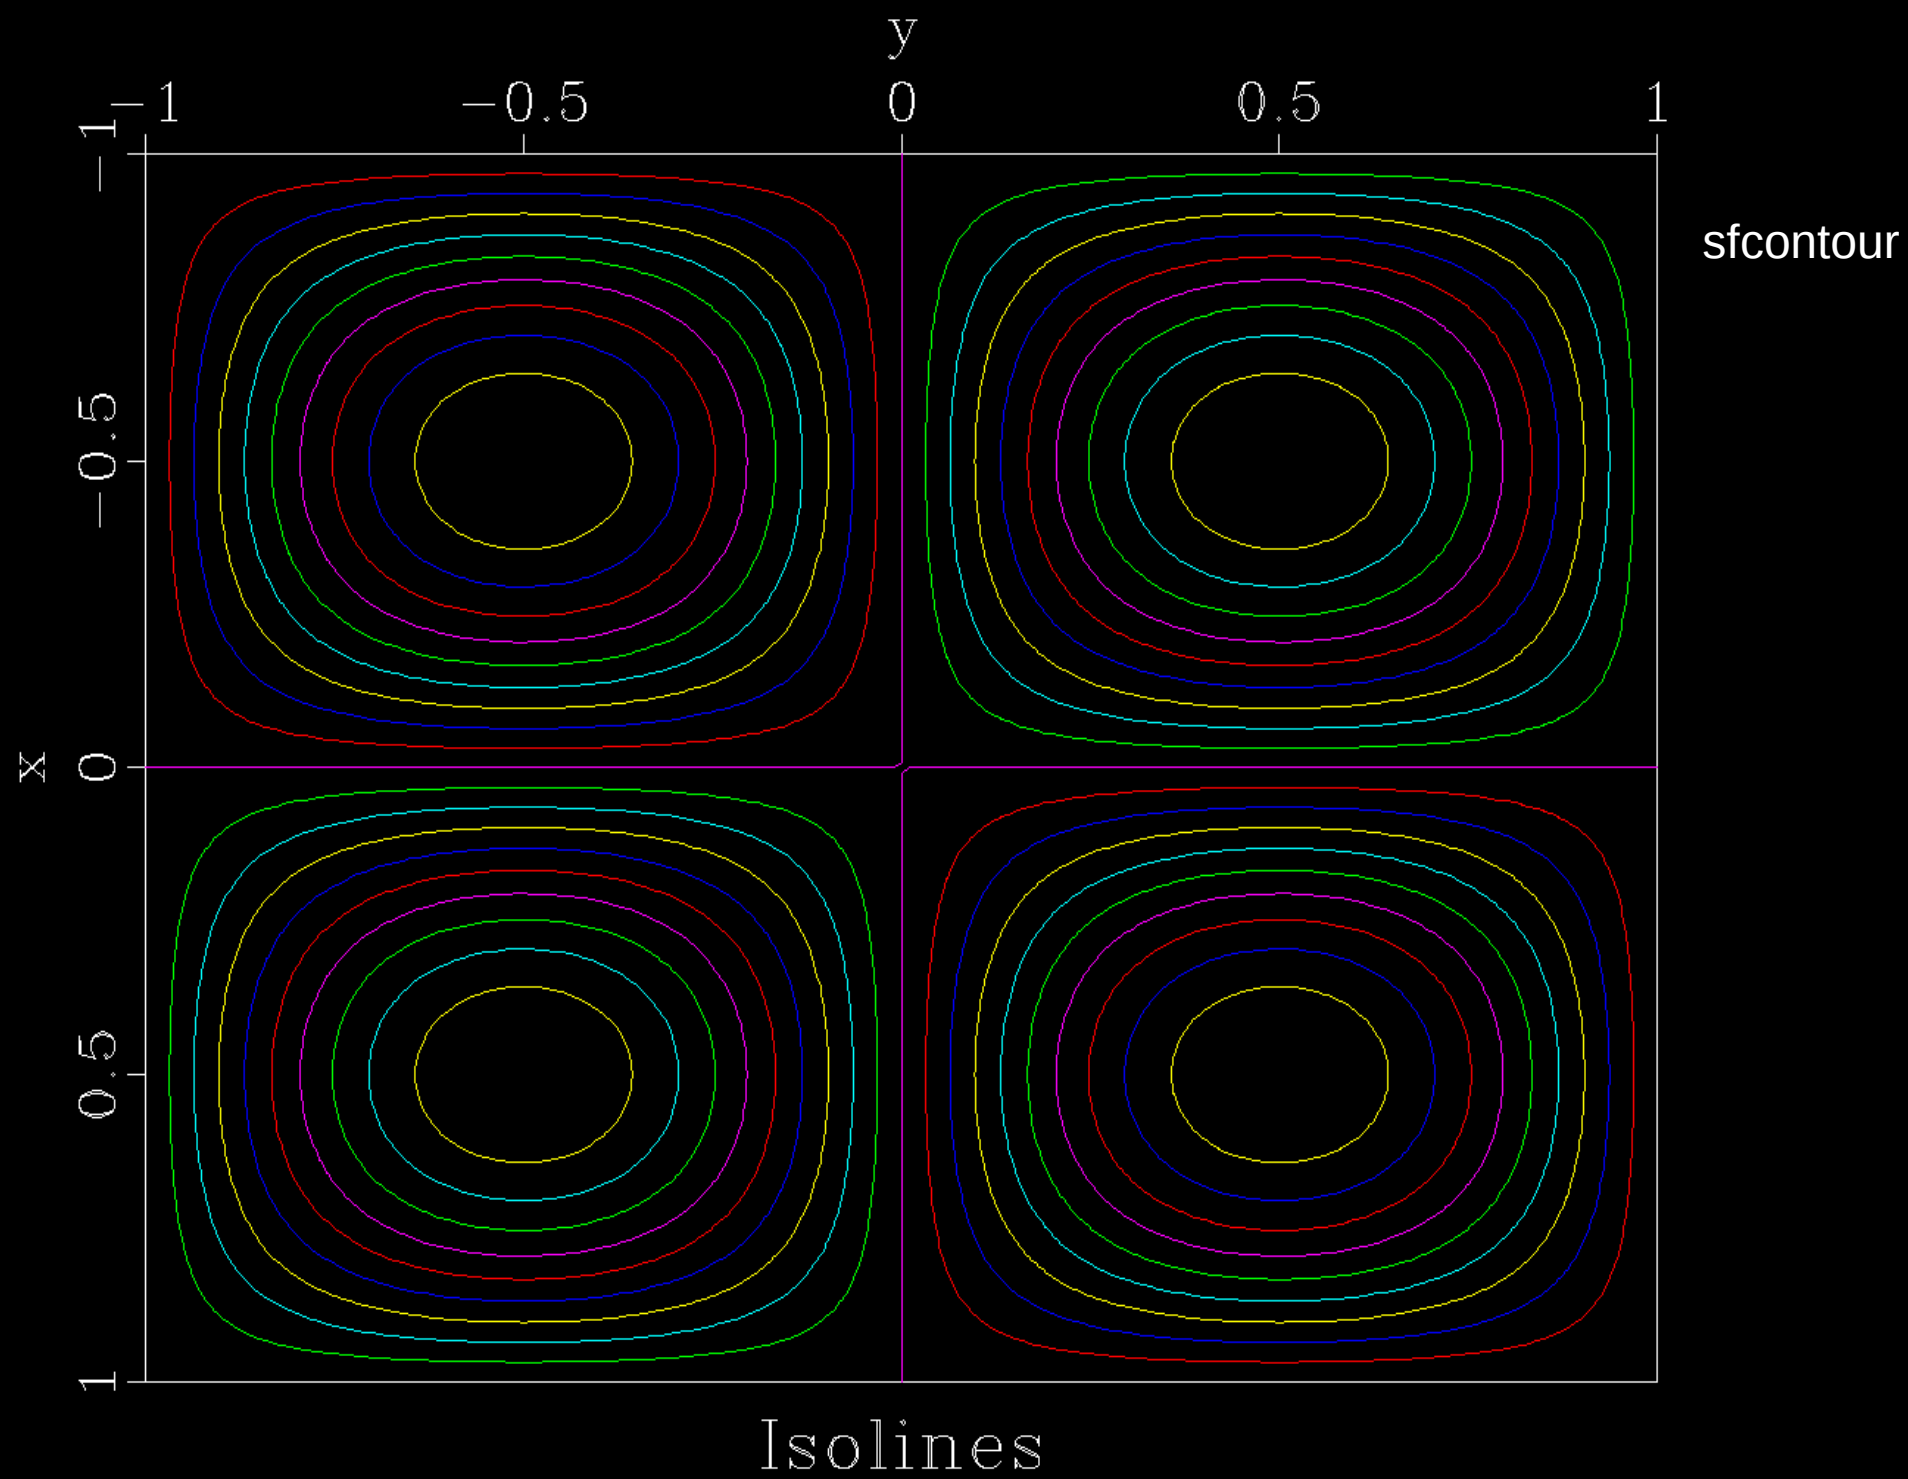

```
Plot(...,'sfgrey color=i ...');  
Result(...,'SideBySideIso')
```

## Slices, flat

Cube

# Plotting

- Numerous ways to make plots in Madagascar:

List of available plotting programs in Madagascar.	
<b>sfbbox</b>	make box-line plots
<b>sfcontour</b>	make contour plots
<b>sfcontour3</b>	make contour plots of 3D surfaces
<b>sfdots</b>	plot signal with lollipops
<b>sfgraph</b>	create line plots, or scatter plots
<b>sfgraph3</b>	generate 3-D cube plots for surfaces.
<b>sfgrey</b>	create raster plots or 2D image plots
<b>sfgrey3</b>	create 3D image plots of panels (or slices) of a 3D cube
<b>sfgrey4</b>	generate movies of 3-D cube plots
<b>sfplotrays</b>	make plots of rays
<b>sfthplot</b>	make hidden-line surface plots
<b>sfwiggle</b>	plot data with wiggly traces

My most  
commonly used  
plotting functions

# Let's generate a plot of our file

- `sfgraph`

# Let's generate a plot of our file

- `sfgraph`
- `sfgraph < file3.rsf > file3.vpl`

# Vplot

- VPLOT provides a method for making plots that are small in size, aesthetically pleasing, and easily compatible with Latex for rapid creation of production-quality images in Madagascar.
- The VPLOT file format (.vpl suffix) is a self-contained binary data format that describes in vector format how to draw a plot on the screen or a page using an interpreter. Since VPLOT is not a standard imaging format, VPLOT files must be viewed with interpreter programs which, for historical reasons, are called pens. Each pen interfaces VPLOT with a third-party graphing library such as X11, plplot, opengl, and others.
- This flexibility makes VPLOT files almost as portable as standard image formats such as: EPS, GIF, JPEG, PDF, PNG, SVG, and TIFF. Unlike rasterized formats, VPLOT files can be scaled to any size without losing image quality.

# How to view vpl files?

- Method 1:
  - Use `vpconvert` to convert from `vplot` to standard format (e.g. avi, gif, jpg, pdf, etc)
- Method 2:
  - Use `sfpen` to plot to screen

# Sfpen

- sfpen renders your plot to the screen
- `< file3.vpl sfpen`

Everything that we did could be done  
in 1 line

- `sfspike n1=100 k1=20 |sfbandpass flo=1  
fhi=20 |sfgraph |sfpen`

# Pop Quiz

- Use:
  - sfspike, sfpen, sfspray, sfbandpass, sfgrey
  - To make something like this:
- Bonus: can you use sfwindow to extract and plot a single trace?

# Solution:

- `sfspike nsp=3 n1=1000 k1=200,600,800 mag=1,-0.5,.5 |  
sfbandpass fhi=5 | sfspray axis=2 n=100 | sfgrey color=e  
title="Can you do this?" | sfpen &`
